THE POPULATION OF INDONESIA

REGIONAL DEMOGRAPHIC SCENARIOS
USING A MULTIREGIONAL METHOD
AND MULTIPLE DATA SOURCES

Proefschrift

ter verkrijging van het doctoraat in de
Ruimtelijke Wetenschappen
aan de Rijksuniversiteit Groningen
op gezag van de
Rector Magnificus, dr. D.F.J. Bosscher,
in het openbaar te verdedigen op
donderdag 2 mei 2002
om 14.15 uur

Salahudin Muhidin

geboren op 10 september 1970
te Jakarta, Indonesie

The book series Population Studies aims at disseminating results of research on population trends, in the broadest sense.

Series editorial board: Anton Oskamp, Ewa Tabeau & Harrie van Vianen.
In memory of Anton Kuijsten.

Manuscripts can be submitted to Rozenberg Publishers, Rozengracht 176A,
1016 NK Amsterdam, The Netherlands. E-mail: info@rozenbergps.com

Total	100	100	100	100	100	100	100	100

Source: As compiled in the 1997 IDHS (ICBS et al., 1998)

The percentage distribution of ASFR, which is calculated by dividing the ASFR with the sum of fertility rates and multiplying the results by 100, is provided in Table 2.5 and shown in Figure 2.5B. Based on the 1997 IDHS data, 11 percent of fertility rates were attributed to the fertility rates of women in age group 15-19 years. This figure shows that although the shape of fertility rates' curves has changed over time, the percentage distributions of fertility rates by age group have been relatively constant, particularly for women in age group 30-34 years. Over time, women aged 30-34 years account for about 19 percent of the total fertility rates. However, this has changed little for women aged 20-29 years: 24 percent in the period 1967-1970 and 28 percent in the period 1995-1997.

In more general terms, the shape of the age distributions of fertility rates may remain invariant, the so-called *no tempo* effect (distortion due to changes in the mean age of childbearing). Once the tempo effects are present, then the distribution may shift to higher or lower ages over time. The TFR that would have been observed in the absence of changes in the timing of childbearing is defined as a quantum (see further discussion about tempo and quantum in Bongaarts and Feeney, 1998). The invariance in Indonesian fertility may due to the fact that the fertility rates were estimated by the indirect methods and clustered into five-year age groups.
